## OPERATIONS DIVISION MONTHLY REPORT

### SUMMARY

The activities of the Operations Division for the month ending November 30, 1953 are summarized and indexed below:

1. Lost graphite reactor operating time averaged 7.6%, compared with 7.7% for the year to date (p. 2).
2. The LITR down time was 10.6%, compared with 13.5% for the year to date (p. 2).
3. Reactor radiation damage tests on LITR neoprene gasket material indicate that the reactor tank gasket has suffered considerable damage (p. 7).
4. The new iodine plant is 80% complete (p. 9).
5. The absorption of carrier-free  $I^{131}$  on metallic silver is being considered as a purification procedure (p. 10).
6. Cesium chloride appears to be a promising compound for use in forming  $Cs^{137}$  sources (p. 11).
7. The average molecular weight of Arco fission-product xenon was determined to be 131.76 (p. 11).
8. There were 1044 radioisotope shipments this month, compared with 1060 in October (p. 12).
9. An increased amount of activity was discharged to White Oak Creek because of Rala wastes: 48 curies, compared with 6.3 curies last month (p. 12).
10. Rala run 54 was a failure because of filtration difficulties (p. 14).

# OPERATIONS DIVISION MONTHLY REPORT

| Slugs discharged                     | 92               | 113             | 1,177                |
| Slugs charged                        | 70               | 95              | 1,080                |
| Product made (g)                     | 90.19            | 94.45           | 1,013.12             |
| Product discharged (g)               | 4.26             | 6.17            | 35.26                |
| <b>Low-Intensity Test Reactor</b>    |                  |                 |                      |
| Reactor power                        |                  |                 |                      |
| Total accumulated (kwhr)             | 1,923,600        | 1,927,573       | 13,175,842           |
| Average kw/operating hr              | 2,988            | 2,994           | 1,900                |
| Average kw/24-hr day                 | 2,672            | 2,591           | 1,644                |
| Lost time (%)                        | 10.57            | 13.5            | 13.47                |
| Position of No. 2 shim rod (in, out) | 20.111*          | 20.382          |                      |

\*This corresponds to approximately 2.9% excess reactivity.

### ORNL Graphite Reactor

There were no slug ruptures during the month. Recently, the uranium metal temperature has been generally below 250°C because the power has not been increased above 3700 kw with the advent of cool weather. The absence of a rupture may be due to the lower metal temperature.

The excess reactivity was quite high during part of November because of the removal of the hole 12 water-cooled facility. An excess reactivity of 200 inhr existed part of the time that this hole was empty. Two poison slugs of cadmium were charged, and a new tube was inserted on November 23 in

hole 12 which reduced the excess reactivity to about 130 inhours. A number of gold slugs will be prepared for replacing the cadmium so that Hg<sup>198</sup> may be produced.

Radioiodine will be produced in several new channels, and the old channels will be left empty so that the excess reactivity will be reduced. If these holes are needed later, they can be recharged.

Operation of the exhaust fans was normal during the month.

The usage of experimental facilities in the ORNL Graphite Reactor is shown in Table 1.

TABLE 1. USAGE OF EXPERIMENTAL FACILITIES - ORNL GRAPHITE REACTOR

| HOLE NUMBER AND ORIENTATION | DIMENSIONS (in.) | DIVISION ASSIGNED TO               | PERSON IN CHARGE | TYPE OF EXPERIMENT OR USAGE   |
|-----------------------------|------------------|------------------------------------|------------------|---|
| 1, north and south          | 4 × 4            |                                    |                  | Regulating rod  |
| 2, north and south          | 4 × 4            |                                    |                  | Regulating rod  |
| 3, north and south          | 4 × 4            | Operations                         | J. A. Cox        | Sulfur exposure for radio-phosphorus production                       |
| 4, north and south          | 4 × 4            | Operations                         | J. A. Cox        | Miscellaneous exposures of special samples                            |
| 5, north and south          | 4 × 4            |                                    |                  | Shim rod  |
| 6, north and south          | 4 × 4            |                                    |                  | Shim rod  |
| 7, vertical                 | 4 × 4            |                                    |                  | Safety rod  |
| 8, vertical                 | 4 × 4            |                                    |                  | Safety rod  |
| 9, vertical                 | 4 × 4            |                                    |                  | Safety rod  |

Table 2 shows a comparison of the pressure drop across the exit air filters last month with the pressure drop this month and with that experienced with clean filters.

**Low-Intensity Test Reactor**

The LITR has continued to operate very satisfactorily at 3000 kw, and it has been possible recently to schedule sample and fuel changes so that the top plug is removed only every two weeks instead of every week. Shutdowns are considerably shorter when the top plug does not have to be removed.

On November 25 after a shutdown, the radioactivity of the circulating water increased to about three times the normal value. It was found that several samples had broken and that enough uranium had been exposed to the water to cause a high activity. When the samples were removed, the activity returned to normal.

The fourth shipment of spent fuel elements was sent to Arco, Idaho on November 10.

A sample of neoprene suspended adjacent to one of the neoprene gaskets in the reactor tank was removed and examined. The elongation was less than 1%, indicating considerable radiation damage. This sample was in the reactor for a sufficient time to accumulate about 15% of the total radiation accumulated by the adjacent reactor gasket.

One bid on two mixed-bed demineralizer columns was received, but since it was rather high, additional bids are being solicited. The specifications for the columns have been rewritten in the hope that more suppliers would be induced to submit bids.

A stainless steel liner has been fabricated for the HB-2 hole and should reduce damage to the aluminum walls of the hole.

The usage of experimental facilities in the LITR is indicated in Table 3.

**Irradiation Services**

Stringers 13, 14, and 16 contained 181 cans of target material at the end of November, as compared with 198 cans of target material at the end of October.

Table 4 shows a comparison of the radioisotope and research samples charged into the ORNL Graphite Reactor during November with those handled in October.

repaired. Special radioisotope preparations for the month are given below:

|                            |             |
|----------------------------|-------------|
| Co <sup>60</sup> sources   | 1360 curies |
| A <sup>37</sup> ampoules   | 2 mc        |
| Tritium ampoules           | 410 mc      |
| H <sup>3</sup> -Zr targets | 8240 mc     |
| H <sup>2</sup> -Zr targets |             |

**RADIOISOTOPE PRODUCTION**

Radioisotope production for the month is given in Tables 5 and 6. No special difficulties were encountered. The yield of I<sup>131</sup> returned to normal this month, and it is now evident that the low yields experienced last month were caused by poor temperature control resulting from erratic operation of the temperature recorder. Yields improved immediately after the instrument was

**RADIOISOTOPE DEVELOPMENT WORK**

**New Iodine-131 Processing Unit, Building 3028**

Installation of piping in cell 2 is complete. The calibration of liquid levels in all vessels was completed, and installation of lines from the cells to the panel board is in progress. The instrumentation is now approximately 50% complete; the installation of all equipment is 80% complete.

**Purification of Iodine-131**

The use of a column containing silver metal packing as a means of concentration and purification of  $I^{131}$  is being investigated. The proposed method involves the passing of the  $I^{131}$  solution over silver metal surfaces where the iodine is retained, apparently as AgI. Iodine is then eluted from the surface in a relatively small volume of a weak solution of  $H_2S$  in water. Tracer runs indicate that there is a high recovery of  $I^{131}$  from feed solutions simulating solutions from the evaporator in the normal  $I^{131}$  process. Studies are being made

to determine (1) the effect of process variables in operating a column packed with silver pellets, including the effects of radiation, (2) the  $I^{131}$  losses incurred in sparging the boiling product solution with nitrogen to remove  $H_2S$ , (3) the chemical purity of the product made by using this procedure.

A few experiments already made indicate that the take-up of  $I^{131}$  on the silver is a rate process, for the highest retention was obtained at the lowest flow rates. Analysis of the product after sparging with nitrogen to remove  $H_2S$  indicated that only about 3% of the product was lost.

TABLE 6. UNPROCESSED RADIOISOTOPE PRODUCTION DURING NOVEMBER

| PRODUCT              | UNITS |

| Total                | 189   |

**Cesium-137**

Two batches of  $\text{Cs}^{137}$  were purified successfully in the recently revised purification equipment. Sixty-nine curies was used to replenish radioisotope stocks; the remainder was placed in storage for experimental purposes.

Physical and chemical studies were made for determining the suitability of using  $\text{CsCl}$  and  $\text{CsF}$  in fabricating sources instead of the  $\text{Cs}_2\text{SO}_4$  previously considered. Cesium fluoride is not so attractive as  $\text{CsCl}$  for this use because of the difficulties in conversion to the fluoride and the corrosion of equipment used in source fabrication. Cesium chloride is being tested to determine its deliquescence, pelletizing characteristics, corrosion effects on various metals, and stability to radiation.

Forty-six curies of pure, dry, fission-product  $\text{CsCl}$  was placed in a glass container in contact with strips of carefully prepared brass, silver-plated brass, and stainless steel. After several months of exposure, the metal specimens will be removed and examined to observe the corrosion effects on the metal. Inactive  $\text{CsCl}$  was used to form pellets by hydraulic pressing at 15,000 psi. It was noted that this compound becomes fluid at these high pressures (at least momentarily) and that a dense, glassy-appearing pellet is produced. Preliminary experiments indicate that the  $\text{CsCl}$  is not deliquescent. Since this result does not confirm data given in the literature, additional data will be obtained.

**Krypton-85**

Developmental work was started on the separation of stable fission-product xenon and radioactive  $\text{Kr}^{85}$  (about 10 y half life) from crude Arco dissolver off-gases. The average molecular weight of the stable xenon fraction separated was determined to be 131.76. This agrees fairly well with the theoretical molecular weight (131.37) calculated from fission yields and is within the experimental error of the method used to determine the molecular weight. Some residual radioactivity was found in the xenon fraction, but analysis indicates that this activity is not  $\text{Kr}^{85}$  or any known xenon radioisotope. Further studies will be made of this activity to identify it and to determine whether it is a previously unknown fission product.

The krypton fraction contains stable krypton,  $\text{Kr}^{85}$ , and argon; therefore further purification work will be necessary on this fraction. Work is also in progress to establish a counting method to assay the  $\text{Kr}^{85}$  activity.

## OPERATIONS DIVISION MONTHLY REPORT

### Fission-Product Precipitation Process, Building 3515

Two hundred eighty liters of W-20 waste was processed for the recovery of fission products; no operational difficulties were encountered. The removal of large amounts of iron by selective precipitation of  $\text{Fe}(\text{OH})_3$  by hydrolysis of urea was successful. Various product fractions are being accumulated in recycle tanks within the unit and, to facilitate storage, will be withdrawn only in highly concentrated form in large batches.

#### Miscellaneous

Among the  $\text{Co}^{60}$  sources loaded this month was a 1300-curie source for the Air Force. This is a somewhat larger source than should be normally loaded in the present facilities; however, the loading was accomplished with no overexposure.

Several batches of  $\text{Ru}^{106}$ , totaling 3796 mc, were prepared for the Chemical Technology Division and will be used in Thorex research work.

The transfer of  $\text{Co}^{60}$  from the reactor canal to the Isotope Area underground storage was con-

tinued. Approximately 40% of the stock has now been transferred.

### RADIOISOTOPE SALES

Radioisotope shipments made during November 1953 are compared in Table 7 with those made during October 1953 and November 1952. A breakdown according to separated and unseparated material (including totals for August 1946 through November 1953) and for project, nonproject, and foreign shipments is also shown.

### RADIOACTIVE-WASTE DISPOSAL

A total of 48.0 curies of beta activity was discharged to White Oak Creek from the settling basin and the retention pond (see Table 8); this discharge is 29% greater than the average for the year to date and was the result of two leaks in the waste lines (in the pit west of Building 3026-C) which carried the wastes from the Rala run. Necessary repairs will be made as soon as the pit is decontaminated sufficiently to allow an adequate amount of working time.

TABLE 8. ACTIVITY DISCHARGED TO WHITE OAK CREEK

| DISCHARGED FROM | NOVEMBER<br>1953  |              | AVERAGE PER MONTH<br>1953 TO DATE |              | AVERAGE PER MONTH<br>1952 |              |
|-----------------|-------------------|--------------|-----------------------------------|--------------|---------------------------|--------------|
|                 | Gallons           | Beta Curies  | Gallons                           | Beta Curies  | Gallons                   | Beta Curies  |
| Settling basin  | 16,484,000        | 47.37        | 19,738,000                        | 24.63        | 21,963,000                | 34.25        |
| Retention pond  | 338,000           | 0.61         | 498,000                           | 12.66        | 385,000                   | 7.25         |
| Total           | <u>16,822,000</u> | <u>47.98</u> | <u>20,236,000</u>                 | <u>37.29</u> | <u>22,348,000</u>         | <u>41.50</u> |

The evaporator operated satisfactorily throughout the month, but the evaporation rate was not permitted to exceed 200 gph during the Rala run because of the high activity content of Rala wastes. Significant evaporator operating data are shown in Table 9.

The free space in both the uranium-waste and chemical-waste storage tanks appears to be adequate for current and anticipated Laboratory usage.

**MISCELLANEOUS OPERATIONS**

**Hanford Irradiations**

The radioisotope samples listed in Table 10 were received from Hanford on November 10.

**Activation Analyses**

A total of 138 requests for information concerning

activation analyses has been received; 52 have developed into requests for analyses, 42 of which have been completed.

**Decontamination**

An automatic washing machine and a drier were installed in the decontamination building for the decontamination of rubber and cotton gloves and for plastic shoe covers. The first several days of operation indicated that several thousand dollars may be saved each year in the Operations Division alone by re-using these materials.

**Water Demineralization**

Demineralized water production was 339,600 gal, compared with 459,000 gal last month.

## OPERATIONS DIVISION MONTHLY REPORT

### RALA

Rala run 54, which was begun on November 4, was unsuccessful because the bulk of the product was lost as a result of equipment failure and continuous processing difficulties, as well as decay; therefore the run was concluded on November 24.

The basic trouble, underlying all others encountered during this run, was the plugging of the process filters. Complete filtration of the sulfate extractions and metatheses was impossible in almost every case, and it became necessary to resort to many changes in the operating procedures, including separations by decantation. Because of frequent unplugging operations on the process filters by the use of air and water under pressure, serious leaks developed in the equipment in the filter cubicle which resulted in very high product losses.

The special procedures followed during this run also resulted in high waste losses. A great deal of time was spent in attempting to recover the product in the wastes, but eventually all these efforts failed. About one half of the product was lost by decay during the extra time spent in processing this run. After 20 days of operating, so little product was left that not even an attempt at a shipment was made; therefore the run was discontinued.

A series of coating-removal and filtration tests is now being made in an effort to establish some process changes which may eliminate a repetition of similar filtration difficulties in the future.

A detailed technical report of this run may be found in a memorandum (ORNL CF-53-12-19) to A. F. Rupp by E. J. Witkowski.

### SF MATERIAL CONTROL

Three shipments consisting of 82 drums containing UNH solutions of depleted uranium were

made to Carbide and Carbon Chemicals Company, Y-12, during the month. The total uranium content of the 82 drums was 6959 kg. These shipments, numbered 32 through 34, were of uranium recovered under the Metal Recovery Program and make a total of 76,966 kg shipped to date.

A fourth shipment of six, spent, LITR, radioactive fuel elements was made during November to Phillips Petroleum Company, Scoville, Idaho, for recovery.

Two hundred ninety-three grams of  $U^{233}$  as  $UO_2(NO_3)_2$  solution was shipped to the Los Alamos Scientific Laboratory.

Two carload-lot shipments were received from Hanford. One shipment consisted of 577 irradiated thorium slugs for the Thorex process, and the other was of 276 irradiated uranium slugs for the Rala process.

During November, the SF Accountability Control Office completed and distributed the *SF Procedures Manual for Oak Ridge National Laboratory X-10 Area*, with the exception of Section 4, "Measurement Procedure," which will be issued shortly after the first of next year.

The SF Accountability Control Office completed the report on outstanding isotope control requests, and it will be issued early in December.

One holder of SF material was visited and the material in his possession was checked and weighed; no discrepancies were noted. The records of three analytical laboratories also were audited and found to be in good order.

During November, there were 25 receipts and 27 outgoing shipments, compared with 21 receipts and 29 shipments last month. Tables 11 and 12 are summaries of receipts and shipments for November.

TABLE 11. SF MATERIALS RECEIVED

| FROM  | MATERIAL         | NUMBER OF SHIPMENTS | AMOUNT (g)   |

| Phillips Petroleum Co., MTI                     | Enriched uranium | 1                   | 0.07         |
| University of Arkansas                          | Normal uranium   | 1                   | 0.27         |
| U.S. Naval Radiological Defense Laboratory, NHP | Normal uranium   | 1                   | 1.28         |

TABLE 12. SF MATERIALS SHIPPED

| TO  | MATERIAL         | NUMBER OF SHIPMENTS | AMOUNT (g)   |
|---|------------------|---------------------|--------------|
| Carbide and Carbon Chemicals Co., Y-12, CYT     | Enriched uranium | 11                  | 518.54       |
|   | Thorium          | 1                   | 34,428.00    |
|   | Normal uranium   | 3                   | 840.26       |
|   | Depleted uranium | 4                   | 6,959,185.06 |
| Iowa State College, ISC                         | Normal uranium   | 1                   | 146.30       |
| Los Alamos Scientific Laboratory, SFC           | U <sup>233</sup> | 1                   | 293.26       |
| North American Aviation, Inc., DNA              | Normal uranium   | 1                   | 20.00        |
| Phillips Petroleum Co., CPI                     | Enriched uranium | 1                   | 660.28       |
| Phillips Petroleum Co., MTI                     | Enriched uranium | 1                   | 0.20         |
| USAEC, Oak Ridge Operations Office, CPA         | Normal uranium   | 1                   | 0.27         |
| U.S. Naval Radiological Defense Laboratory, NHP | Normal uranium   | 1                   | 0.26         |
| Westinghouse Electric Corp., WEM                | Normal uranium   | 1                   | 539.00       |
