

# ***Reactor Physics Analysis of the VHTGR Core***

**Oak Ridge National Laboratory  
December 2-3, 2004**

**Wei Ji, Jeremy L. Conlin, William R. Martin, and John C. Lee  
Nuclear Engineering and Radiological Sciences  
University of Michigan  
wjiz@umich.edu**

# *Introduction*

- **This is one of the tasks of the I-NERI project**
  - **I-NERI Project: Develop safety analysis codes and experimental validation for the VHTGR**
  - **Develop reactor physics models for power distribution and decay heat**
  - **Perform coupled neutronic/thermal-hydraulic analysis of VHTGR**

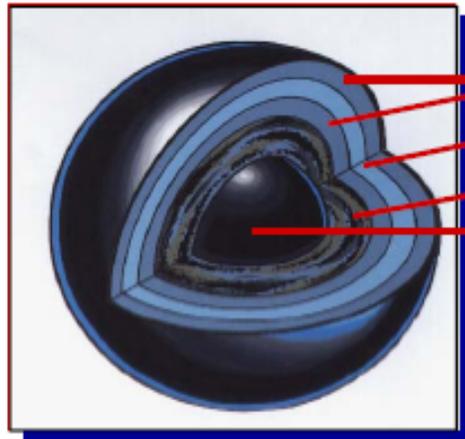

## *Development of MCNP models*

- Detailed microsphere models for analysis of double heterogeneity
- Assembly-level model for analysis of detailed geometry
- Full-core models for global calculations of flux and power distributions

# VHTGR fuel (from General Atomic)

- Pyrolytic Carbon
- Silicon Carbide
- Porous Carbon Buffer
- Uranium Oxycarbide

TRISO Coated fuel particles (left) are formed into fuel rods (center) and inserted into graphite fuel elements (right).

PARTICLES

COMPACTS

FUEL ELEMENTS

# *MCNP5 Simulations of Microsphere Cells*

- ❑ **Single microsphere cell consists of fuel microsphere and graphite matrix to yield packing fraction = 0.289**
- ❑ **Enrichment=10.36%**
- ❑ **Microsphere cell is either heterogeneous (explicit modeling of all regions: fuel kernel, carbon buffer, SiC, and inner/outer pyrolytic carbon shells) or homogenized mixture of microsphere and graphite matrix**
- ❑ **Analyzing two region microsphere cell: fuel kernel and remainder of microsphere/graphite matrix**
- ❑ **Reflecting boundaries on six surfaces of cube**

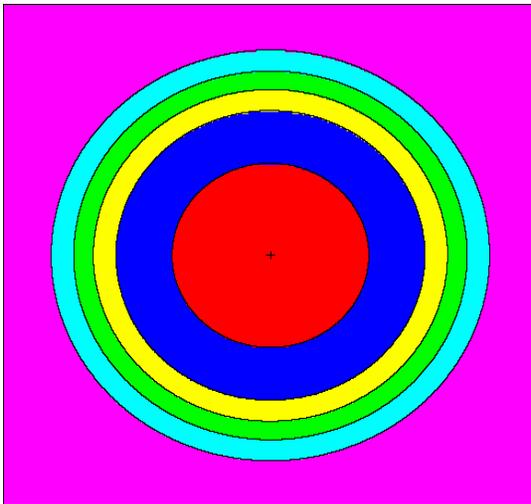

## ***Sensitivity calculation – thermal expansion***

- ❑ Thermal expansion of graphite taken from CERN report (temperature dependent)
- ❑ MCNP full core calculation (hexagonal block core with reflectors and homogeneous blocks)
- ❑ All linear dimensions multiplied by  $1 + \alpha\Delta T$
- ❑ All densities divided by  $(1 + \alpha\Delta T)^3$
- ❑ Results indicate thermal expansion is negligible:

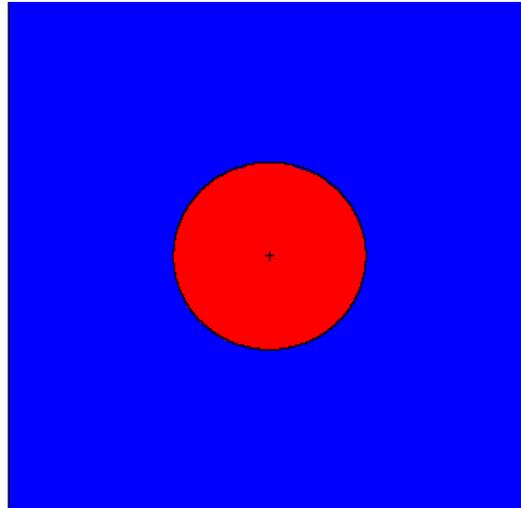

Case	keff	std dev
Room temp	1.43953	0.00094
1000 C	1.43800	0.00081
2000 C	1.43788	0.00076

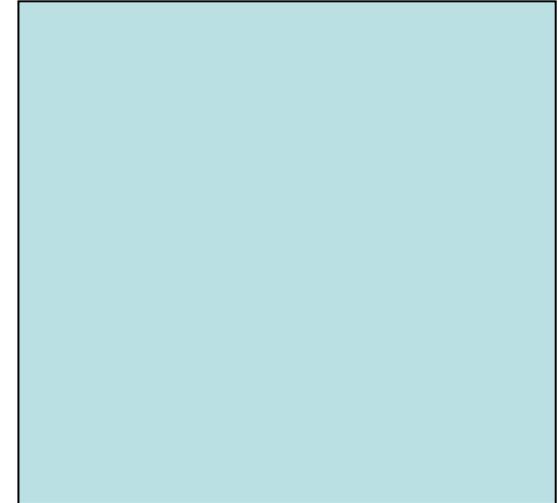

# *Microsphere cells – microsphere in graphite matrix cube*

Fully Heterogeneous

Two-Region Heterogeneous

Homogeneous

Reflecting b.c. on all sides of cubes

# *MCNP5 Simulations of Microsphere Cells*

<b>Configuration</b>	<b>Kernel location</b>	<b>keff</b>	<b>std dev</b>
<b>Homogeneous microsphere cell</b>	<b>- - -</b>	<b>1.0995</b>	<b>.0004</b>
<b>Two-region heterogeneous microsphere cell</b>	<b>Centered</b>	<b>1.1535</b>	<b>.0004</b>
<b>Fully heterogeneous microsphere cell</b>	<b>Centered</b>	<b>1.1533</b>	<b>.0003</b>
<b>Fully heterogeneous microsphere cell (LANL)</b>	<b>Random</b>	<b>1.1515</b>	<b>.0004</b>

*Essential to model the microsphere heterogeneity  
(at least the fuel kernel portion of the microsphere)*

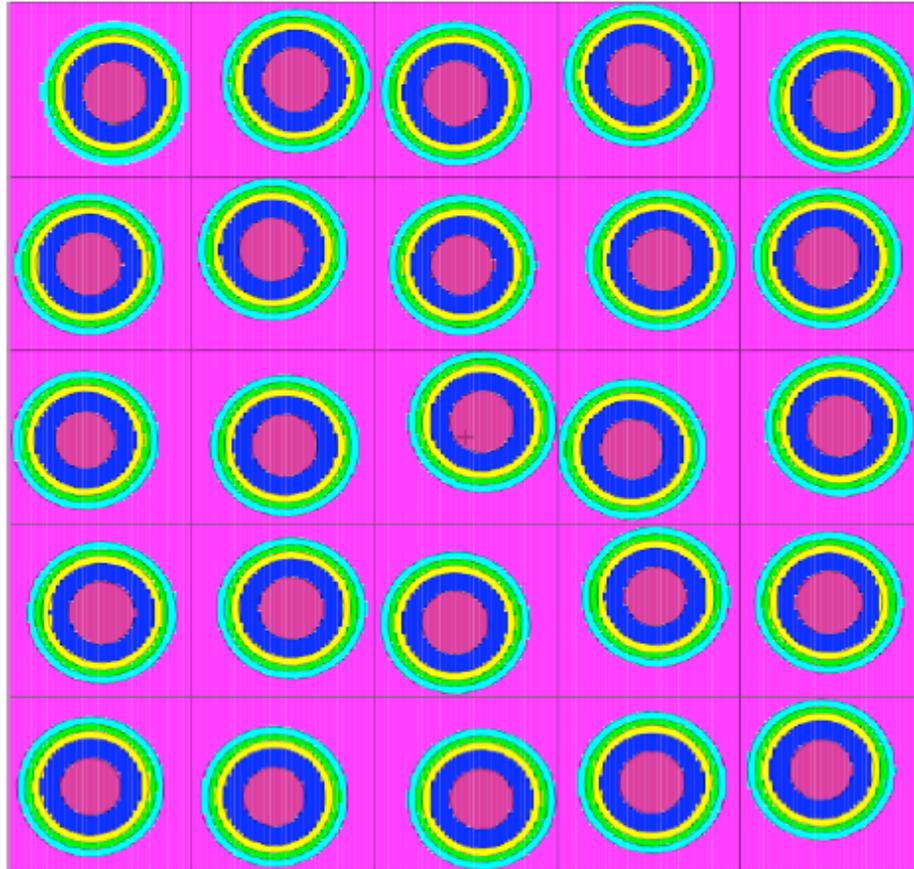

# ***Alternative method – using modified version of MCNP5 to treat stochastic geometry***

- ❑ Forrest Brown - head of Los Alamos MCNP team
- ❑ Modified MCNP5 to effectively ***move the microsphere randomly*** within the graphite cube every time the neutron crossed the cell boundary
- ❑ Analyzed a 5x5x5 array of heterogeneous microsphere cells with reflecting b.c. on all sides – used UM data
- ❑ Compared with 25 realizations of an explicit 5x5x5 simulation with randomly oriented spheres

\*Forrest B. Brown and William R. Martin, “Stochastic Geometry in MCNP5,” submitted to Winter 2004 ANS Conference in Washington, DC, LANL report LA-UR-04-4432, June 2004.

## *5x5x5 lattice of cubic microsphere cells*

- Reflecting b.c on all sides
- Spheres randomly oriented wholly within graphite cubes
- “On the fly” randomization versus 25 realizations of 5x5x5 lattice

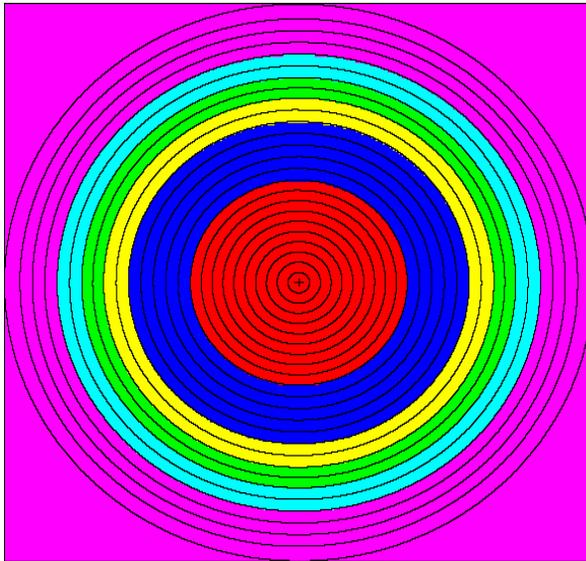

# LANL MCNP5 simulation results

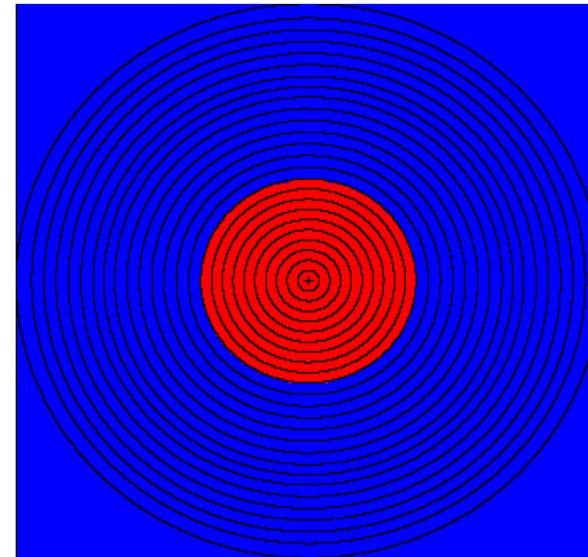

Configuration	Kernel locations	keff	std dev
5x5x5 lattice of heterogeneous microsphere cells	Centered	1.1531	.0004
5x5x5 lattice of heterogeneous microsphere cells	Random – on the fly	1.1515	.0004
Multiple (25) realizations of 5x5x5 cells	Random	1.1513	.0005
Single heterogeneous microsphere cell (UM)	Centered	1.1537	.0011

# *Microsphere cells– multi-group radial flux profiles analysis*

Fully Heterogeneous

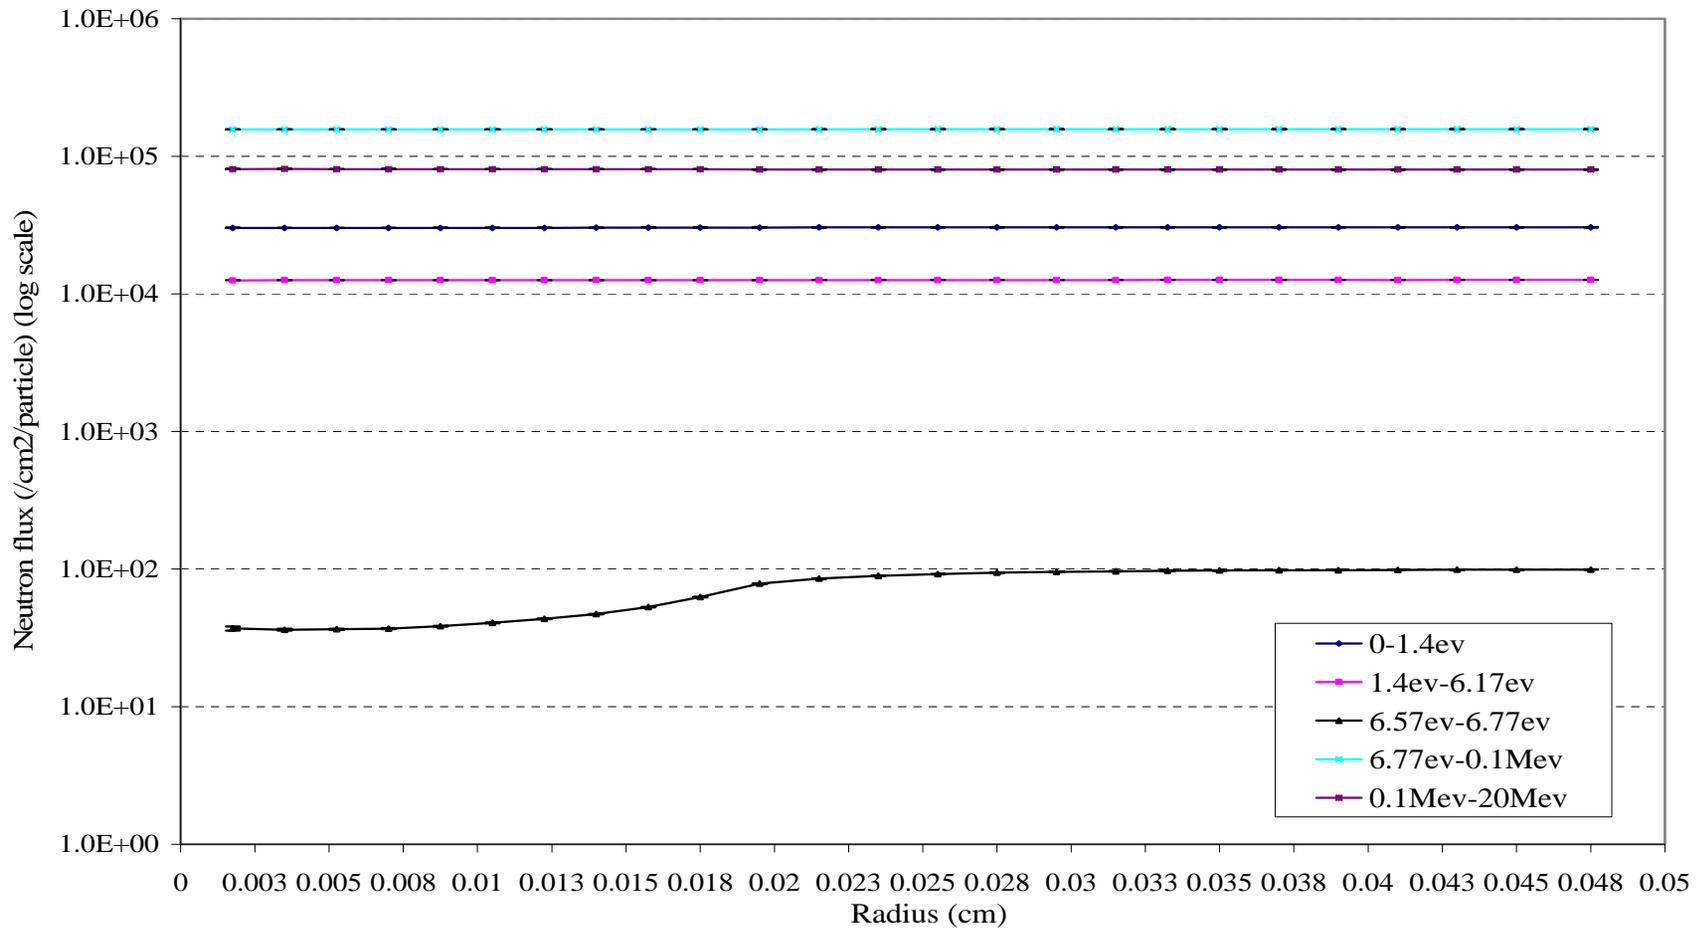

Two-Region Heterogeneous

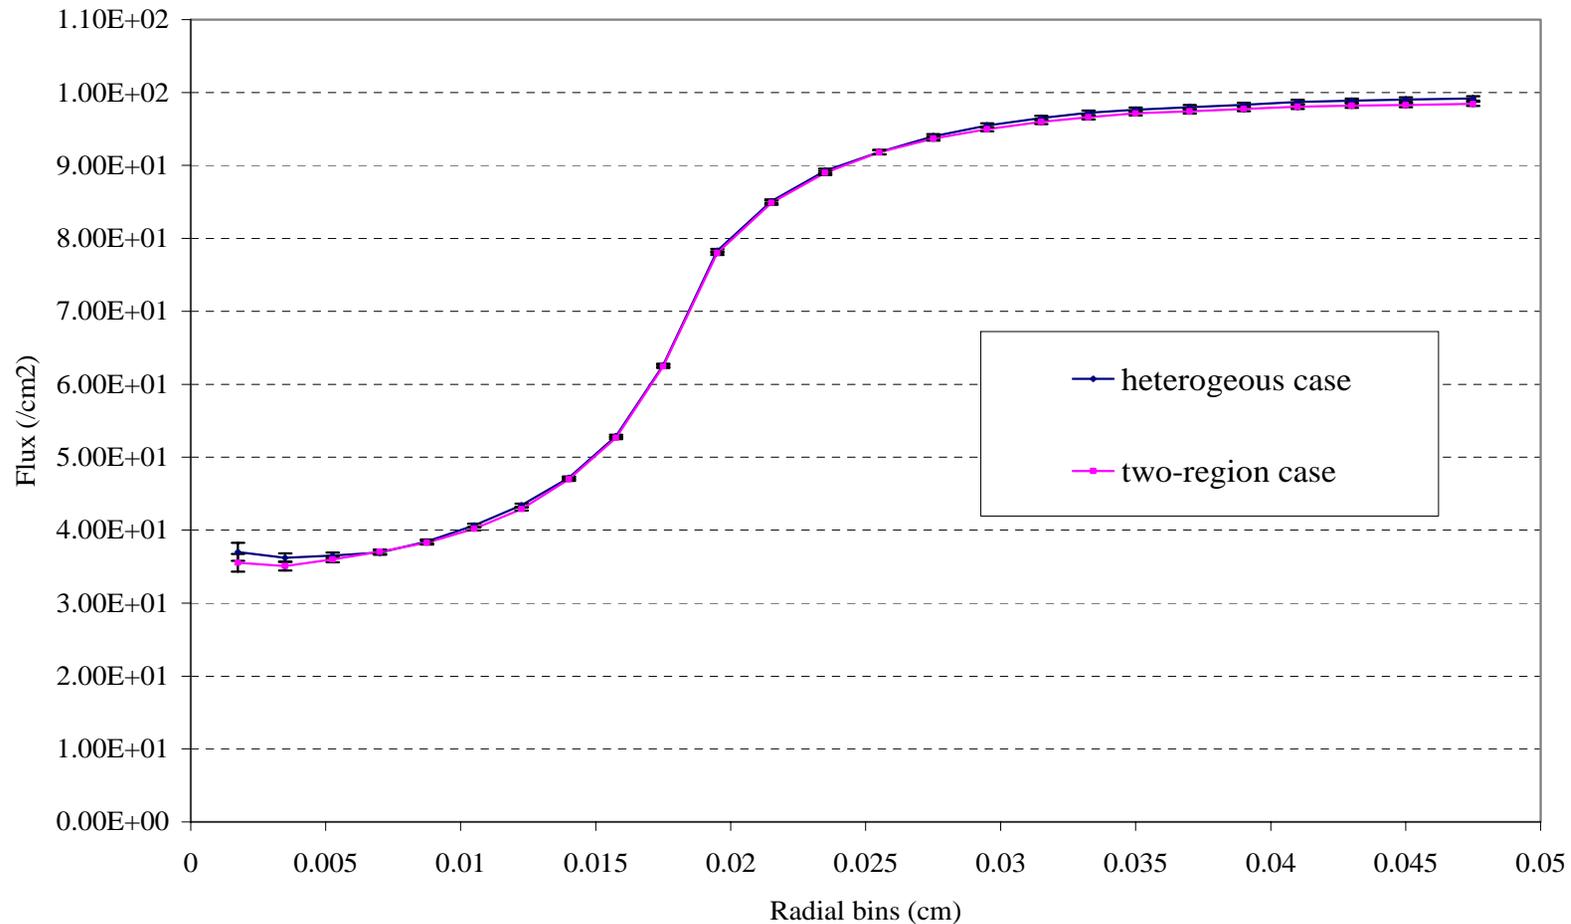

Reflecting b.c. on all sides of cubes

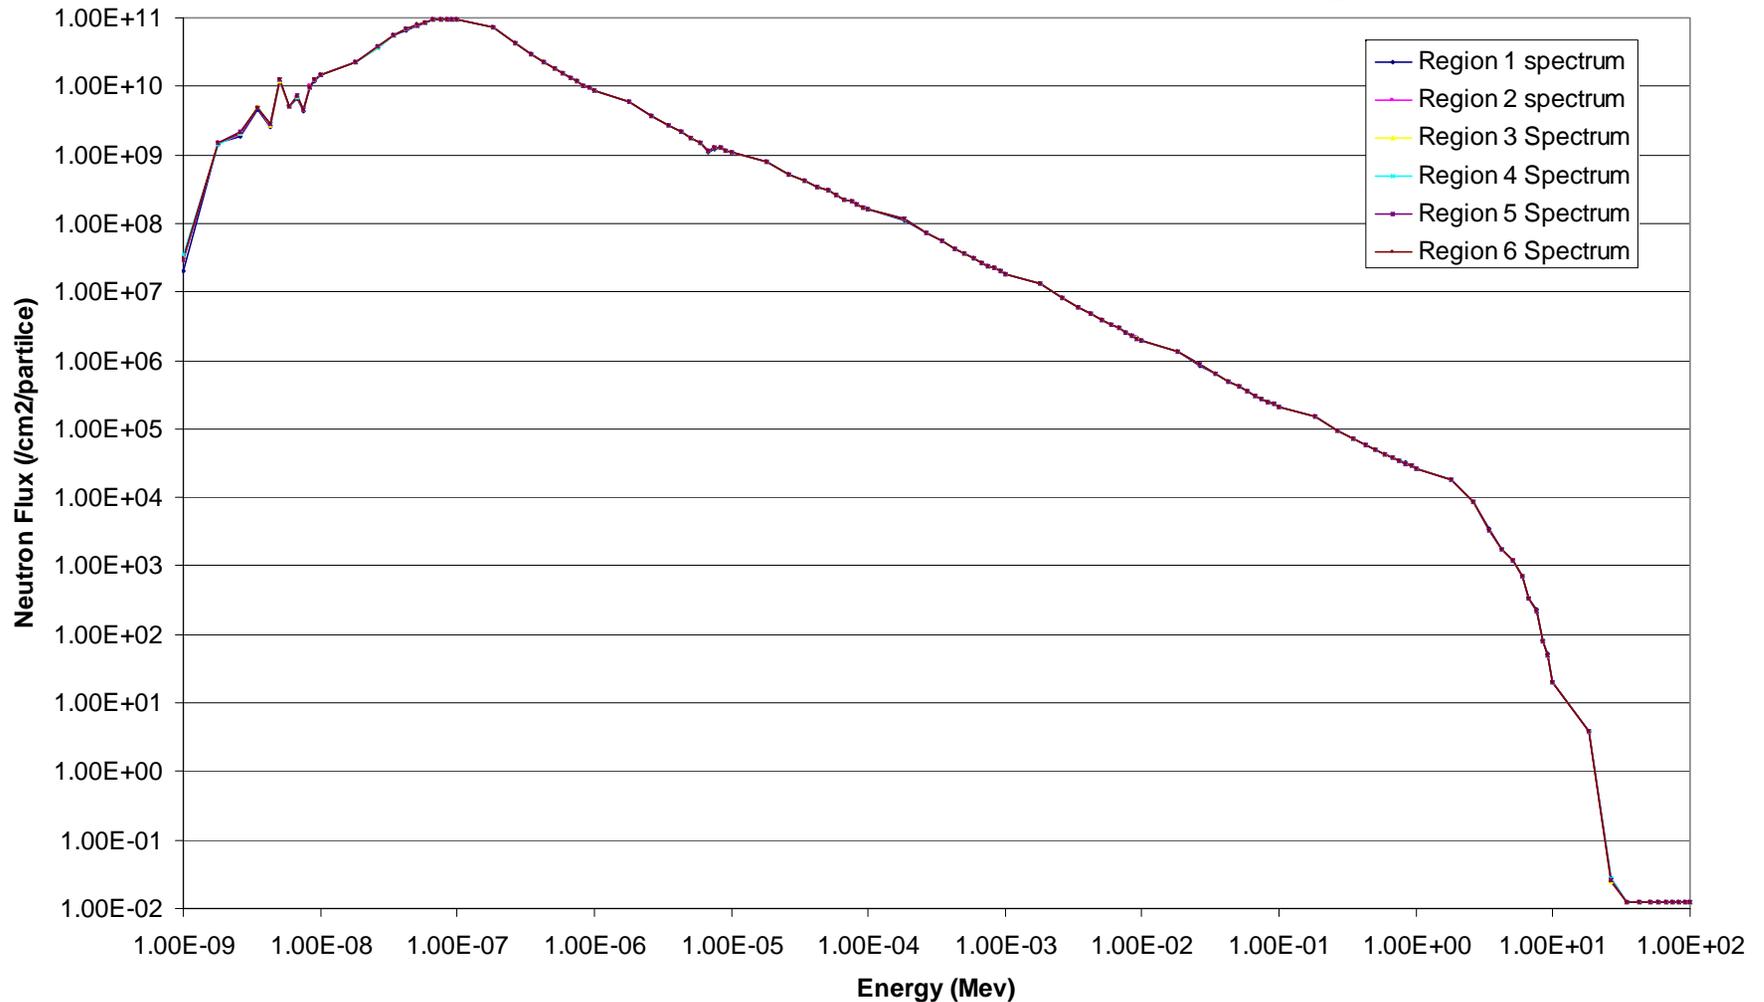

# Radial neutron flux profile in a fully heterogeneous microsphere cell

# Comparison of the radial neutron flux profiles in resonance energy range 6.57eV - 6.77 eV

# Neutron spectra in microsphere regions

# ***Preliminary conclusions – heterogeneous microsphere cells***

- ❑ Essential to model the detailed geometry of the microsphere**
- ❑ The location of the microsphere within the graphite cube has .2% effect on  $k_{eff}$  – for the infinite lattice of microspheres**
- ❑ The microsphere is small neutronicly for all neutrons except resonance neutrons**
- ❑ Should be OK to treat only the fuel kernel and homogenize the outside layers of the microsphere with the graphite matrix**

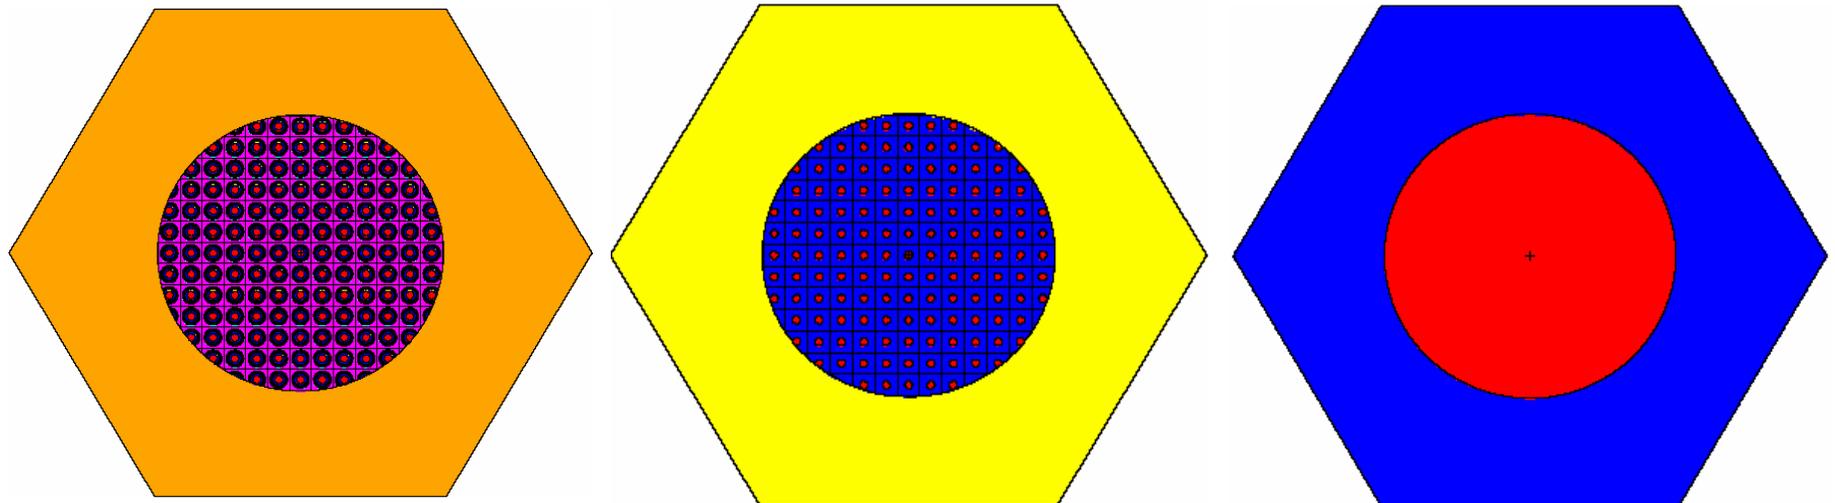

# ***MCNP5 Simulations of Fuel Compact Cells***

- ❑ Fuel compact and corresponding graphite block (boron-10: 6.9ppm)**
- ❑ Hexagonal graphite block with cylindrical fuel region**
- ❑ Fuel region consists of cubical microsphere cells (homogeneous and heterogeneous)**
- ❑ Cubical microsphere cells “clipped” by cylindrical fuel boundary**
- ❑ Coolant holes and inner/outer/axial reflectors are not represented in the fuel compact cell – only the relative changes in  $k_{eff}$  are significant**

# *Fuel compact cells – graphite block with microsphere cells*

Fully Heterogeneous

Two-Region Heterogeneous

Homogeneous

Reflecting b.c. on all surfaces of fuel compact cell

# MCNP5 Simulations of Fuel Compact Cells

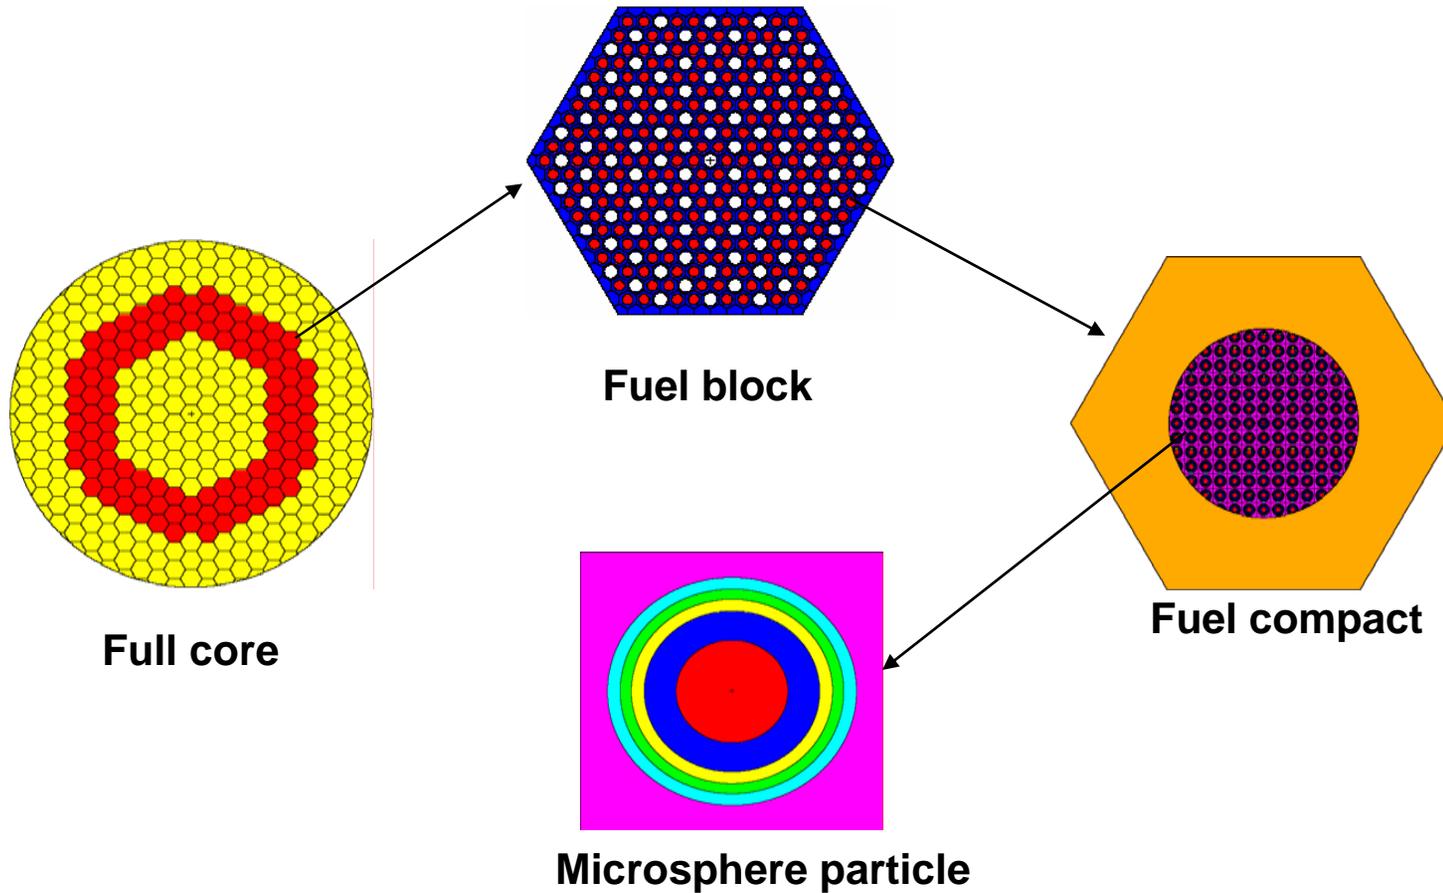

<b>fuel compact</b>	<b>keff*</b>	<b>std dev</b>	<b>time (min)</b>
<b>Homogeneous case</b>	<b>1.2885</b>	<b>.0004</b>	<b>359.26</b>
<b>Two-region heterogeneous case</b>	<b>1.3408</b>	<b>.0004</b>	<b>1462.44</b>
<b>Fully heterogeneous case</b>	<b>1.3401</b>	<b>.0004</b>	<b>2872.42</b>

**\*These configurations do not account for coolant holes or reflector regions – change in keff is important**

***The same conclusion: essential to model the microsphere heterogeneity (at least the fuel kernel portion of the microsphere)***

# Full core reactor – double heterogeneity

## ***MCNP5 Simulations of the Full Core***

<b>full core</b>	<b>keff</b>	<b>std dev</b>	<b>time (min)</b>
<b>Homogeneous case</b>	<b>1.0153</b>	<b>.0002</b>	<b>250.24</b>
<b>Fuel block-level heterogeneous case</b>	<b>1.0583</b>	<b>.0001</b>	<b>663.74</b>
<b>Doubly heterogeneous-two region</b>	<b>1.0949</b>	<b>.0004</b>	<b>2272.51</b>
<b>Doubly heterogeneous-fully</b>	<b>1.0949</b>	<b>.0003</b>	<b>4847.45</b>

***The same conclusion: essential to model the microsphere heterogeneity (at least the fuel kernel portion of the microsphere)***

## ***Coupled Nuclear-T/H Calculations***

- Need to represent feedback effect of axial temperature rise of 350 K on VHTR core power distribution.**
- Used a pseudo-material scheme to interpolate MCNP cross section libraries at a few temperature points.**
- Used homogenized assembly model in 12 axial zones and 3 rings (30/37/36 assemblies) with MCNP5.**
- INEEL provided UM access to RELAP5/ATHENA.**
- Performed 4 iterations between MCNP5 and RELAP5.**

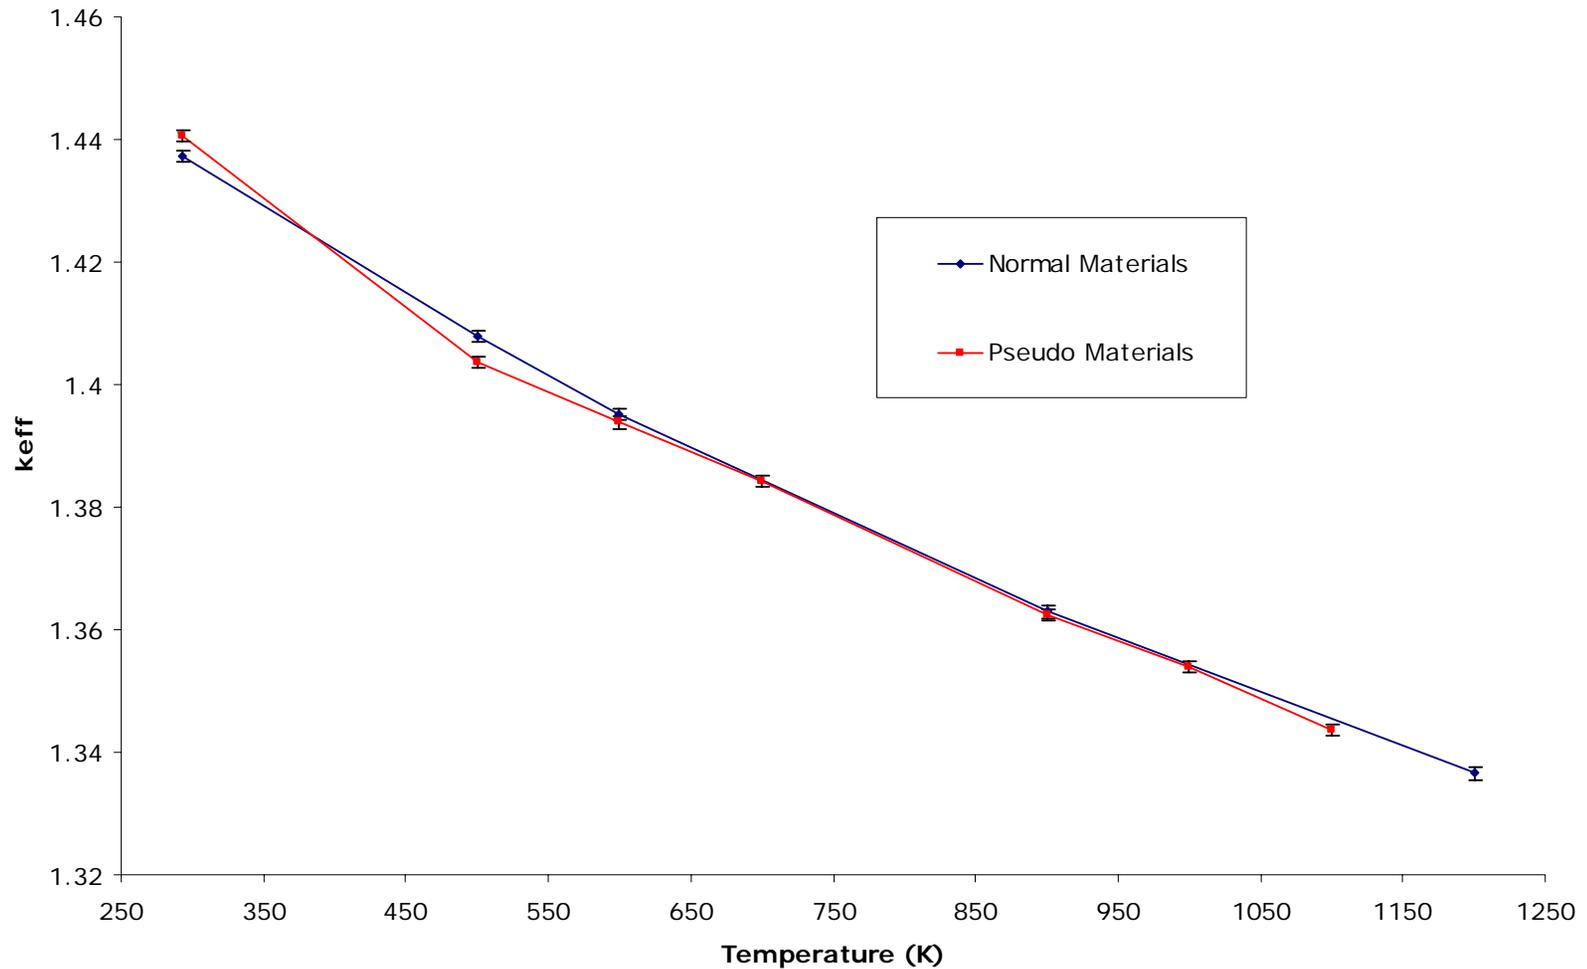

# *Pseudo-materials*

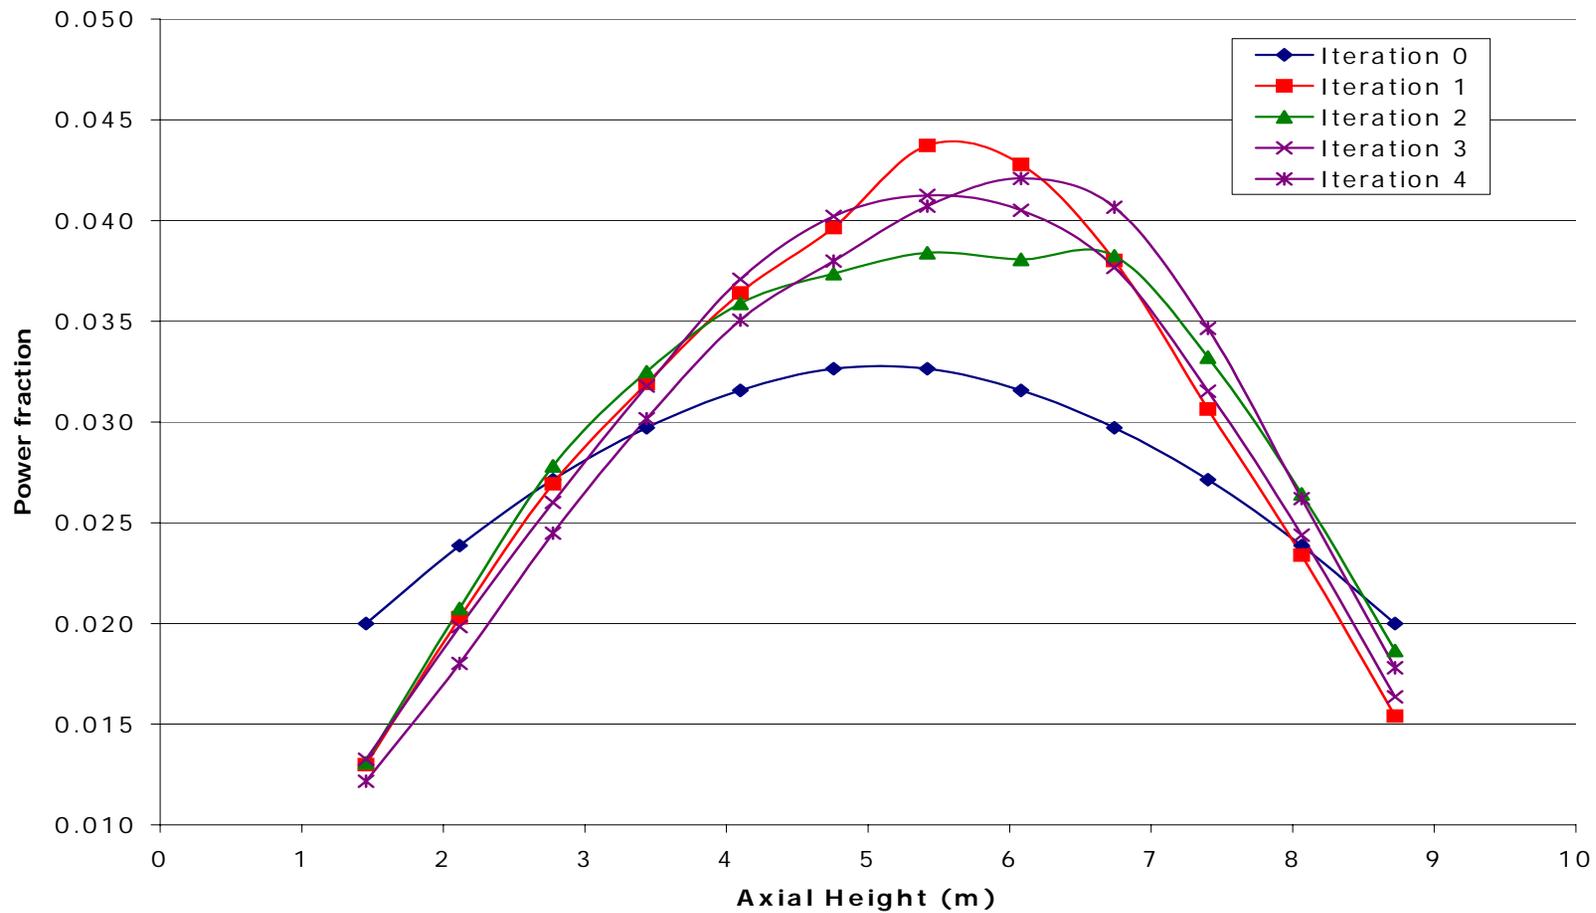

- ❑ MCNP5 cross section data only provided at specific temperatures, e.g., 294K, 500K, 600K, 900K, and 1200K
- ❑ Coupled neutronic/T-H feedback calculations will require cross sections in the range 294K-1400K or higher
- ❑ Pseudo-materials are proposed by mixing generated cross sections linearly with temperature
- ❑ **Example: to get a material at 1000K, create a mixture consisting of 2/3 of material at 900K and 1/3 at 1200K**
- ❑ A Python script was written that reads in temperatures and existing libraries and generates material data cards that can be used directly in the MCNP5 input file

# Comparison of $k_{eff}$ with pseudo-materials

# Axial power distribution in the middle core ring

## ***Conclusions and future work***

- ❑ Critical to model double heterogeneity of the fuel microspheres**
- ❑ May be sufficient to treat only the fuel kernel portion**
- ❑ Coupled neutronic/T-H calculations are more slowly converging than originally envisioned**
- ❑ Need to study further the effects of criticality calculations due to the stochastic distribution of the microsphere fuel particles**
