

# A path forward to improve the representation of fine roots in terrestrial biosphere models

Colleen M. Iversen

Climate Change Science Institute and  
Environmental Sciences Division  
Oak Ridge National Laboratory  
13 August 2014

Co-conspirators:

Luke McCormack (CAS)  
Jeff Warren (ORNL)  
Anthony Walker (ORNL)  
Xiaojuan Yang (ORNL)  
Dali Wang (ORNL)

A continuing goal is to **LINK** empirical data with model structure and process.

Models may help pinpoint mechanisms and explain dynamic responses

# Models may help pinpoint mechanisms and explain dynamic responses

Iversen, 2010 (*New Phytologist*)

# Continuing issue is appropriate representation of root form & function at multiple scales

At the global scale, plant functional types (PFTs) are groups of traits that represent, or relate to, **PLANT FUNCTION** in large-scale models.

'Tree Roots', Vincent van Gogh, 1890

Most plants are grouped into PFTs according to **ABOVEGROUND** traits.

How can we inform the representation of **BELOWGROUND PROCESSES** in large-scale models through PFTs?

We (empirical scientists) need to **PROACTIVELY** provide the information needed for model parameters and processes.

---

## WORKSHOP GOAL:

---

# Improve the representation of roots in the next-generation **TERRESTRIAL BIOSPHERE MODELS.**

\*Workshop support from Office of Biological and Environmental Sciences in the Department of Energy's Office of Science

It was important to bring together an interdisciplinary team of **ROOT AND RHIZOSPHERE ECOLOGISTS, MODELERS, and DATABASE MANAGERS.**

# Workshop continued a historical focus on fine roots and their representation in models

# Workshop continued a historical focus on fine roots and their representation in models

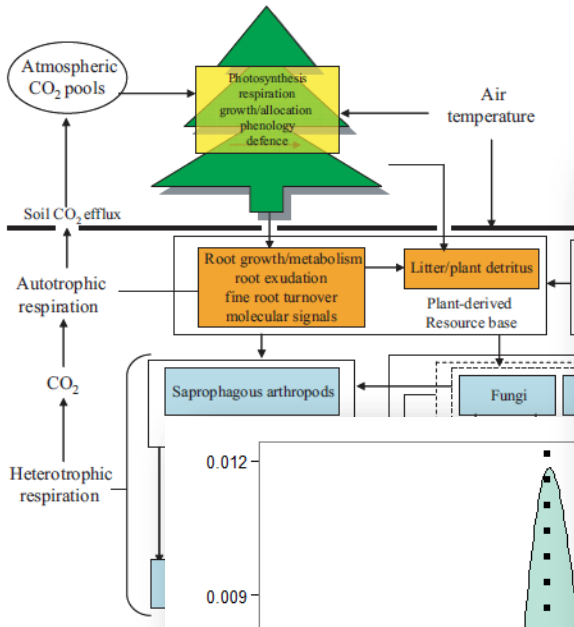

What are the gaps between current  
**MODEL REPRESENTATION** of roots and  
**EMPIRICAL UNDERSTANDING** of roots  
based on current measurements?

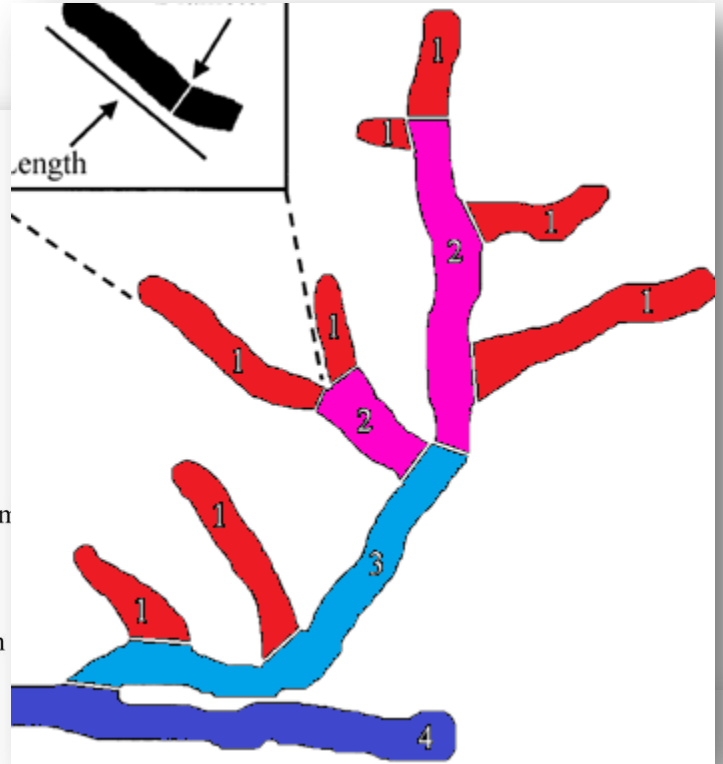

Do we agree on an **IDEAL**  
**CONCEPTUAL REPRESENTATION** of root  
processes that could be made  
numerical in a model? What are the  
**PRIORITIES** for the next steps in the  
evolution of model representation?

AM hyphal dynamics

Hyphal length (h)  
 $a = \text{segment length} = 0.5 \text{ cm}$   
 $h = a(1) + a(2) + a(4)$

geometric series  
 $a = \text{segment length} = 0.5 \text{ cm}$   
 $r = \text{branch ratio} = 2$   
 $n = \# \text{ branches, } 1-8$

$h = \sum_1^n [a(r^n - 1)] / (r - 1)$   
 $h = 122 \text{ cm/entry point}$

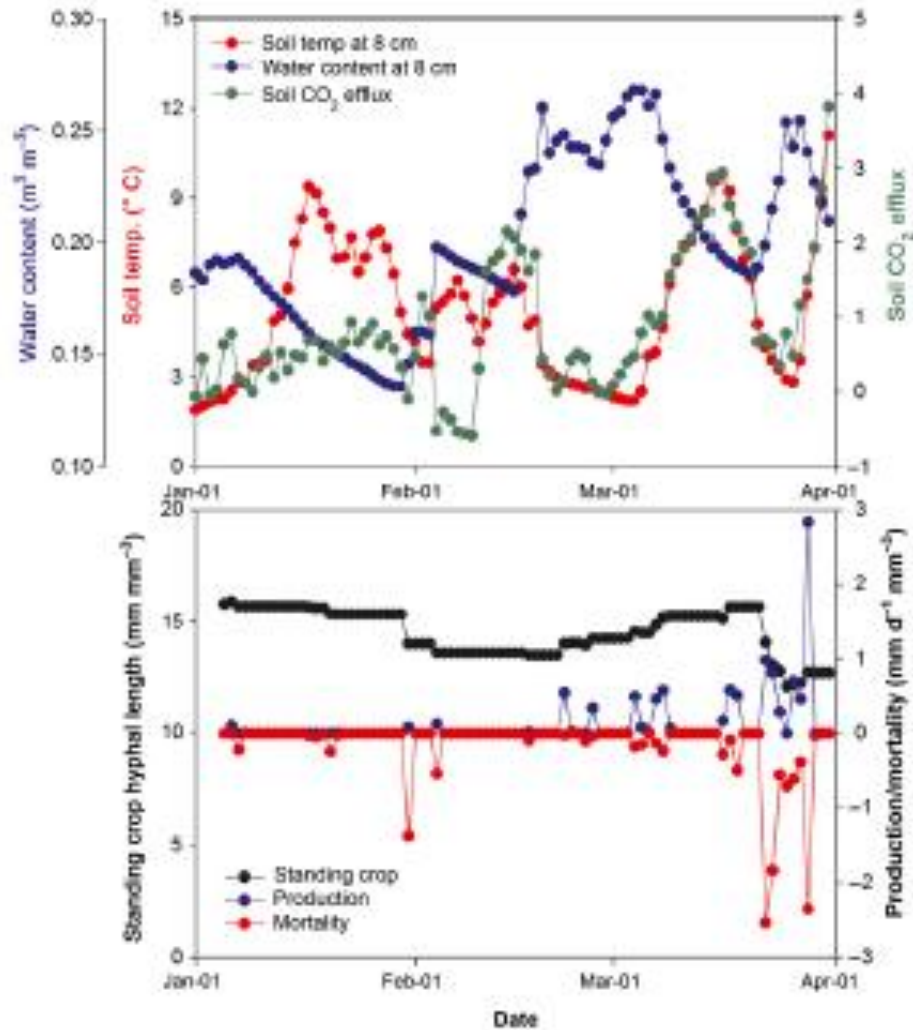

What are the **BEST ROOT DATA AVAILABLE** across the globe for model use?

# Root traits underrepresented in TRY

Do we have continuous measurements of the relationships between **ROOT PROCESSES AND ENVIRONMENTAL CONDITIONS** for representation in models?

# Continuous sensor and observation systems are needed

We developed a **PATH FORWARD** to improve the representation of fine roots in terrestrial biosphere models.

---

## 1. A ROOT TRAIT DATABASE:

---

Develop a **ROOT TRAIT DATABASE**,  
and let it guide our priorities for  
future data collection.

## 2. IMPROVED MODEL INTERFACE:

Develop a **MODULARIZED VERSION OF THE COMMUNITY LAND MODEL** to test effects of environmental drivers on root and rhizosphere dynamics, and effects of changing model parameters on ecosystem processes.

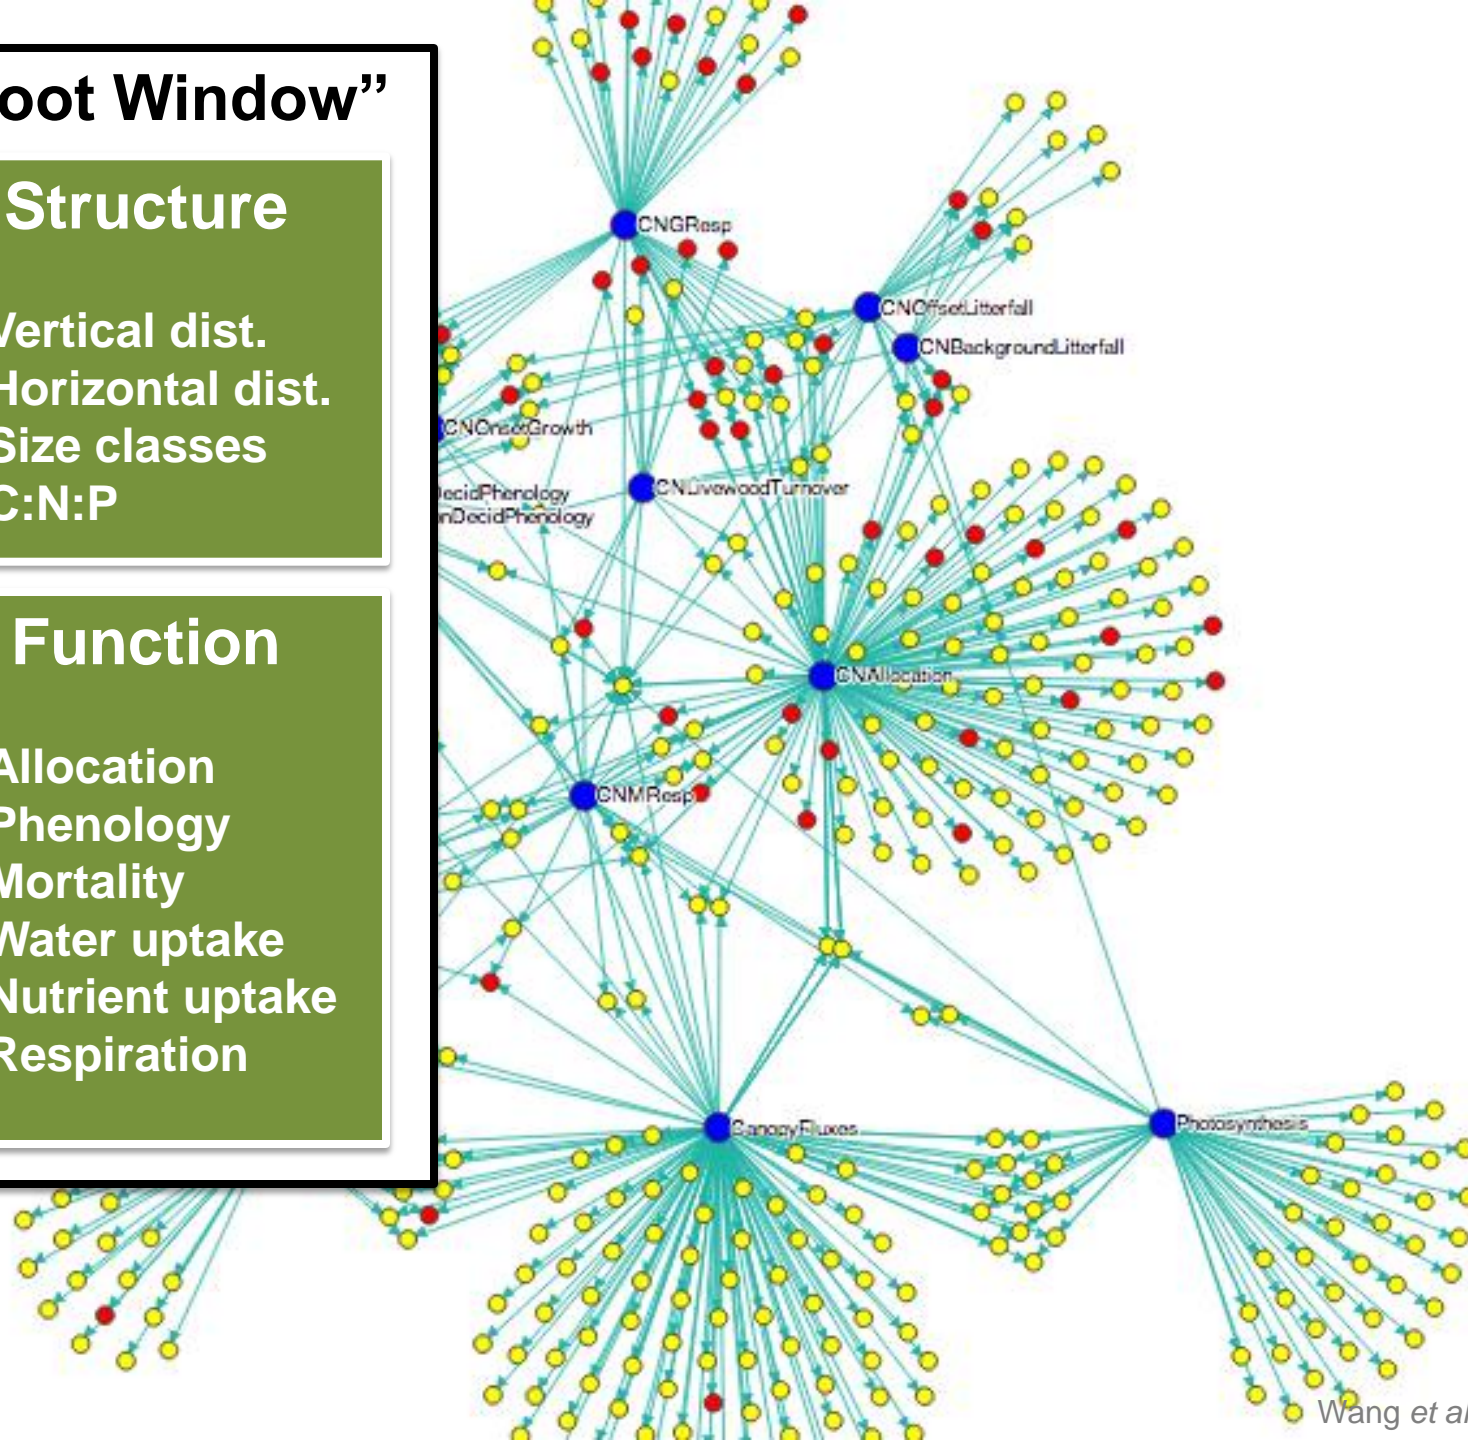

# “Root Window”

## Structure

### 3. MODIFIED MODEL STRUCTURE:

Add an **ADDITIONAL FINE-ROOT POOL** to the Community Land Model representing ephemeral, **ABSORPTIVE ROOTS**, and parameterize PFTs with data compiled in the root trait database.

# Where global data are unavailable, begin with phylogeny

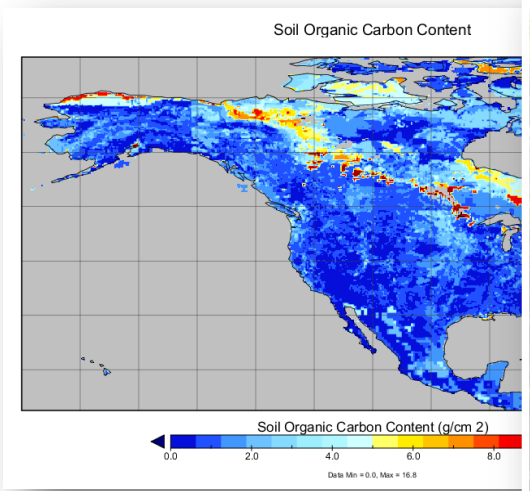

## 4. CONTINUE TO SOLICIT COMMUNITY INPUT:

Gain a **CONSENSUS FROM THE BROADER COMMUNITY** on the relative importance of different root traits.

There are some things that **WE DON'T UNDERSTAND** well enough to represent in terrestrial biosphere models.

The **NEXT STEPS** in our understanding of roots and their role in the ecosystem involve **NEW QUESTIONS, NEW METHODS, NEW TECHNOLOGY**, and **IMPROVED REPRESENTATION** of root processes in models of all scales.

## WHAT IF MY RESEARCH ISN'T ON FINE ROOTS?

Fine roots are where I **START** thinking about ecosystem processes, but not where I stop, and models need the bigger picture too.

**WHOLE-PLANT C ALLOCATION · SOIL NUTRIENT AVAILABILITY · SOIL C STORAGE**

To track our progress, and **LEND YOUR VOICE** (and your data) to the effort, following us at:
